

Annual Drinking Water Quality Report for 2023

Town of Stuart

PWSID 5141640

INTRODUCTION

This Annual Drinking Water Quality Report for calendar year 2023 is designed to inform you about your drinking water quality. Our goal is to provide you with a safe and dependable supply of drinking water, and we want you to understand the efforts we make to protect your water supply. The quality of your drinking water must meet state and federal requirements administered by the Virginia Department of Health (VDH).

If you have questions about this report or want additional information about any aspect of your drinking water or want to know how to participate in decisions that may affect the quality of your drinking water, please contact:

Mr. Tony Boothe, Water Plant Manager
(276) 694-3902

The time and location of the regularly scheduled council meeting is as follows:

Third Wednesday of each month at 7:00 PM at the Town Office

GENERAL INFORMATION

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Water from surface sources is treated to make it drinkable while groundwater may or may not have any treatment.

Contaminants that may be present in source water include:

- **Microbial contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic contaminants**, such as salts and metals, which can be naturally-occurring or result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
- **Pesticides and herbicides**, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses.
- **Organic chemical contaminants**, including synthetic and volatile organic chemicals, which are byproducts of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.
- **Radioactive contaminants**, which can be naturally-occurring or be the result of oil and gas production and mining activities.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water and provided by public water systems. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health.

All drinking water, including bottled drinking water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information can be obtained by calling the Environmental Protection Agency's Safe Drinking Water Hotline (800-426-4791).

VULNERABLE POPULATIONS

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbiological contaminants are available from the Safe Drinking Water Hotline (800-426-4791).

SOURCE(S) AND TREATMENT OF YOUR DRINKING WATER

Our water supply is from surface water. The primary raw water source is the South Mayo River. An auxiliary source of water is available from Carter Mountain Reservoirs.

Treatment of the surface water consists of chemical addition, coagulation, flocculation, settling, filtration, fluoridation and chlorination. All of these processes work together to remove the physical, chemical and biological contaminants to make the water safe for drinking.

A source water assessment of our system was conducted in 2001 by the Virginia Department of Health. The river source was determined to be of high susceptibility to contamination while the reservoir sources were determined to be of moderate susceptibility to contamination. These determinations were based upon criteria developed by the state in its approved Source Water Assessment Program.

The assessment report consists of maps showing the source water assessment area, an inventory of known land use activities of concern and documentation of any known contamination within the last five years. The report is available by contacting your water system representative at the phone number given elsewhere in this drinking water report.

WATER CONSERVATION TIPS

Did you know that the average U.S. household uses approximately 350 gallons of water per day? Luckily, there are many low-cost or no-cost ways to conserve water. Water your lawn at the least sunny times of the day. Fix toilet and faucet leaks. Take short showers - a 5 minute shower uses 4 to 5 gallons of water compared to up to 50 gallons for a bath. Turn the faucet off while brushing your teeth and shaving; 3-5 gallons go down the drain per minute. Teach your kids about water conservation to ensure a future generation that uses water wisely. Make it a family effort to reduce next month's water bill!

DEFINITIONS

Contaminants in your drinking water are routinely monitored according to federal and state regulations. The table on the next page shows the results of this monitoring for the period of January 1st through December 31st, 2023. In the table and elsewhere in this report you will find many terms and abbreviations you might not be familiar with. The following definitions are provided to help you better understand these terms:

Non-detects (ND) - lab analysis indicates that the contaminant is not detectable, based on the limits of the analytical equipment used.

Parts per million (ppm) or Milligrams per liter (mg/l) - one part per million corresponds to one minute in two years or one penny in \$10,000.

Parts per billion (ppb) or Micrograms per liter (µg/l) - one part per billion corresponds to one minute in 2,000 years, or one penny in \$10,000,000.

Picocuries per liter (pCi/L) - picocuries per liter is a measure of the radioactivity in water.

Nephelometric Turbidity Unit (NTU) - nephelometric turbidity unit is a measure of the cloudiness of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

Action Level (AL) - the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

Maximum Contaminant Level Goal (MCLG) - the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Maximum Contaminant Level (MCL) - the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Residual Disinfection Level Goal (MRDLG) – the level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

Maximum Residual Disinfectant Level (MRDL) – the highest level of a disinfectant allowed in drinking water. There is

convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

Treatment Technique (TT) - A required process intended to reduce the level of a contaminant in drinking water.

WATER QUALITY RESULTS

We routinely monitor for various contaminants in the water supply to meet all regulatory requirements. The table lists only those contaminants that had some level of detection. Many other contaminants have been analyzed but were not present or were below the detection limits of the lab equipment.

TEST RESULTS						
Contaminant / unit of measurement	Violation Y/N	Level Detected/Range	Sample Date	MCLG	MCL	Likely Source of Contamination
Microbiological Contaminants (ND)						
Total Coliform Bacteria (Present or absent)	N	No samples total coliform present	Monthly at two sample sites	0	Presence of coliform in no more than 1 sample per month	Naturally present in the environment and are used as an indicator that other potentially-harmful, bacteria that may be present.
Turbidity / NTU	N	0.130(highest level) 100 % < 0.3	Daily	NA	1.0 Max TT 0.3 in 95 % of monthly samples	Soil runoff
Lead and Copper						
Lead (ppb)	N	< 2 (90 th percentile) Range: All = ND Of the 10 samples collected none exceeded the AL	2021	0	AL = 15	Corrosion of household plumbing systems; erosion of natural deposits.
Copper (ppm)	N	0.099 (90 th percentile) Range = <0.02-.103mg/l Of the 10 samples collected none exceeded the AL.	2021	1.3	AL = 1.3	Corrosion of household plumbing systems; erosion of natural deposits.
Inorganic Contaminants						
Nitrate + Nitrite (ppm)	N	<0.05 ppm	November 2023	10	10	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits.
Fluoride (ppm) (Split Samples)	N	Average= 0.72 Range = 0.46 - .90	Monthly 2023	4	4	Water additive which promotes strong teeth
Fluoride (ppm) (Entry Point)	N	0.52	November 2023	4	4	Erosion of natural deposits; Water additive which promotes strong teeth
Disinfection Byproducts						
Chlorine (ppm)	N	Average=1.0 Range: 0.4 -1.6	Monthly at two sample sites	4	4	Chlorine is added to insure that water is disinfected
TTHM [Total trihalomethanes] (ppb)	N	RAA = 37 Range: 21 - 45	Quarterly 2023	N/A	80	By-product of drinking water chlorination
HAA [Haloacetic Acids] (ppb)	N	RAA = 34 Range: 10 - 41	Quarterly 2023	N/A	60	By-product of drinking water chlorination
TOC range = ppm TOC Removal ratio Total Organic Carbon	N	Range 0.32 to 0.46 Removal Ratio: = 1	Quarterly 2023	NA	TT- TOC Removal Ratio greater than or equal to 1	Naturally present in the source water
Radium was detected within previous 5 years						
Combined radium (pCi/L)	N	0.2	December 2019	0	5	Erosion of natural deposits

Compliance sampling in November showed the **Sodium concentration to be 7.69 mg/L**, which is below the maximum recommended level of 20 mg/L set by the EPA. The recommended level is established for those individuals on a sodium-restricted diet. If you have any concerns about the Sodium level in your drinking water, you may wish to consult with your physician.

The results in this table are from testing done from 2023. However, the State allows us to monitor for some contaminants less than once a year because the concentrations of these contaminants do not change frequently. We constantly monitor for various contaminants to meet all regulatory requirements. The table lists only those contaminants that had some level of detection. Other contaminants were either not present or below the detection limits of the laboratory equipment. Some of our results, though representative, are more than one year old.

The U.S. Environmental Protection Agency sets MCLs at very stringent levels. In developing the standards EPA assumes that the average adult drinks 2 liters of water each day throughout a 70-year life span. EPA generally sets MCLs at levels that will result in no adverse health effects for some contaminants or a one-in-ten-thousand to one-in-a-million chance of having the described health effect for other contaminants.

Additional information on Lead:

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Town of Stuart is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 15 to 30 seconds or until it becomes cold or reaches a steady temperature before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

VIOLATIONS: The Town of Stuart had no violations in 2023.

AWARDS:

The Town of Stuart has earned a 2023 “Silver” Excellence in Waterworks Operations/ Performance Award. The Town of Stuart Water Plant has received a VOP award every year since the award program was implemented in 2005.
